BioMedix Introduces CustomLab® SQL Edition Software
CustomLab® for vascular lab management now enables HIPAA compliance

TWIN CITIES, MN - June 16, 2005 - Today BioMedix introduced the latest edition of its popular vascular laboratory management software CustomLab, with a new SQL Edition at the Vascular Annual Meeting, the premier annual meeting for specialists who treat vascular disease held in Chicago, IL.

There are an estimated 2,000 vascular laboratories in the United States and all face daily pressures to increase patient volumes, maintain quality and accreditation and economic pressure to contain costs. In addition there are medical and legal imperatives to keep appropriate and necessary records. Without useful tools like CustomLab hundreds of hours of paperwork would be required to complete the detailed questionnaires, also known as the Application. The Application is used to demonstrate that Essential Standards of the Intersocietal Commission of Vascular Laboratories (ICAVL) are met. Accreditation is a symbol of quality and accredited labs in most states are entitled to reimbursement under Medicare for medically necessary vascular exams.

CustomLab SQL Edition supports direct download of patient demographics and study results from popular imaging ultrasound equipment as well as from all of the BioMedix family of physiologic test devices. It counts procedures and generates study correlation tables. It also supports download of data into the ICAVL electronic application. Jerry Mapes, BioMedix's lead developer of the SQL edition project notes: "The new edition is based on a client server architecture which supports Microsoft SQL-server back end databases. The switch from a file server to a client server architecture is a major advance in terms of security, stability, and speed of data transmission particularly for larger client installations". John Romans, BioMedix CEO had this to add: "Our new version will appeal to our most demanding information technology customers who expect their applications to be secure by offering data encryption and password protection (HIPAA requirements), stability, and more.

CustomLab offers vascular program efficiencies in workflow, clinical documentation, charging/billing and reporting. And it is the only vascular lab database product that supports direct download of physiologic and imaging studies, which can save 10-20 minutes per patient in time transferring data".

About BioMedix

BioMedix is the fastest growing provider of equipment and services in the market for non invasive detection of peripheral vascular disease (PVD). Unique technology also links primary care physicians and vascular surgeons in the early detection of PAD through simple web-enabled vascular testing devices, software and services. Innovative vascular lab and surgery suite management software tools also enable vascular care system providers to meet clinical and economic objectives.
